

#### ANDROID SENSOR SYSTEM

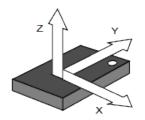

#### Outline

- Sensors in Android
  - SW
    - Android sensor framework and implementation
  - HW
    - 3-axis e-compass hardware introduction

### Sensors in Android

- Example
  - Hardware
    - STMicro LSM303DLHC 3-axis e-compass module
      - 3-axis G-sensor (m/s²) and 3-axis M-sensor (gauss)
      - 3-axis e-compass
        - Using G/M-sensor data to compute heading
  - Software
    - Android 4.0

DIRECTION OF DETECTABLE ACCELERATIONS

DIRECTION OF DETECTABLE MAGNETIC FIELDS

#### Software Architecture

**Java Program** 

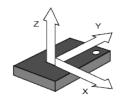

**Android Framework** 

**Sensor Library** 

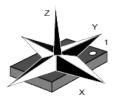

**Linux Driver** 

### Java App on Android

- Android support several sensor types and provide unified interface to control them.
  - In android 4.0, there are 13 data types.
    - G-sensor, M-sensor, Gyro-sensor, Light sensor, ...
  - Android defines several rules for app programmer
    - Data polling rate
      - SENSOR\_DELAY\_FASTEST
      - SENSOR DELAY GAME
      - SENSOR\_DELAY\_UI
      - SENSOR\_DELAY\_NORMAL
    - 3-axis dimension
    - etc.

DIRECTION OF DETECTABLE ACCELERATIONS

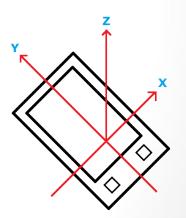

0 ms)

20 ms)

( 60 ms)

(200 ms)

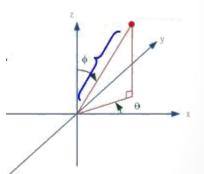

### Java Program

- Classes and interface of android sensor framework
  - Sensor class
    - Instance of a specific sensor
      - Get sensor's capabilities
  - SensorEvent class
    - Instance of sensor event
      - Get raw data
  - SensorManager class
    - Instance of sensor service
      - Register/unregister, access, acquire orientation, ...
  - SensorEventListener interface
    - Monitor sensor value/accuracy changed event

## Sensors in Android Framework

- Sensors in android framework
  - User registers/unregisters listener for accessing sensor service
  - User proposes the need for data exporting
    - which sensor and data rate
  - User could only get
    - Static
      - Features of sensors
    - Dynamic
      - raw data
      - processed information by android (eg. orientation, ...)

### Sensor Library in Android

- Sensor library provides necessary callback functions for android to control sensors.
  - Sensor manager in android framework
    - Manages sensor resource for java apps
    - Passes control commands and dispatches data
  - In sensor library, we could implement extra features in Linux user-space.
    - Eg 1. orientation fixing
    - Eg 2. For cost-down, we may use cheap sensor module. However, we could develop some algorithm to improve its performance.

### Callback Functions in Sensor Library

- Callback functions should be implemented
  - Open data source
    - Initial the sensor library
  - Close data source
    - Exit the sensor library
  - Activate
    - Start/Stop sensor
  - Set delay
    - Set the time interval of sensing
  - Poll
    - Poll all the sensors to get data
  - Wake
    - Stop sensor polling compulsively

**Enter/Exit Sensor Library** 

**Sensor State Setting** 

**Run-time Data Retrieving** 

#### Sensor Data Packet

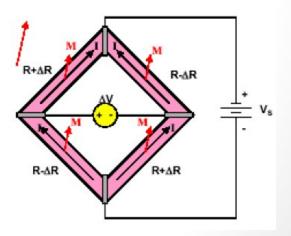

- sensors\_event\_t structure
  - sensor type
  - timestamp
  - reserved

```
float data[16];
sensors_vec_t acceleration; /* (m/s^2) */
sensors_vec_t magnetic; /* micro-Tesla (uT) */
sensors_vec_t orientation; /* degrees */
sensors_vec_t gyro; /* rad/s */
float temperature; /* Celsius */
float distance; /* centimeters */
float light; /* lux */
float pressure; /* hPa */
float relative_humidity; /* percent */
}
```

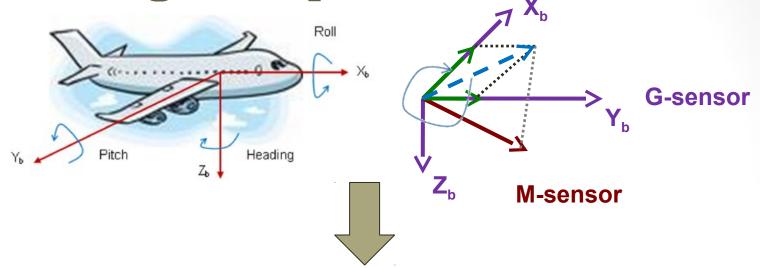

10

# LSM303DLHC 3-axis E-Compass

- Control hardware module and get data with I<sup>2</sup>C bus.
- G-sensor
  - Two interrupt line for special situation
  - Output data rate
  - Output data range
- M-sensor
  - Output data rate
  - Output data range
  - Enable/disable temperature exporting

Heading Computation

Pitch = 
$$\rho$$
 = arcsin( $-A_{x1}$ )  
Roll =  $\gamma$  = arcsin( $A_{y1}/\cos\rho$ )  
 $M_{x2} = M_{x1}\cos\rho + M_{z1}\sin\rho$   
 $M_{y2} = M_{x1}\sin\gamma\sin\rho + M_{y1}\cos\gamma - M_{z1}\sin\gamma\cos\rho$   
 $M_{z2} = -M_{x1}\cos\gamma\sin\rho + M_{y1}\sin\gamma + M_{z1}\cos\gamma\cos\rho$ 

Heading = 
$$\psi = \arctan\left(\frac{M_{y2}}{M_{x2}}\right)$$
 for  $M_{x2} > 0$  and  $M_{y2} >= 0$ 

$$= 180^{\circ} + \arctan\left(\frac{M_{y2}}{M_{x2}}\right)$$
 for  $M_{x2} < 0$ 

$$= 360^{\circ} + \arctan\left(\frac{M_{y2}}{M_{x2}}\right)$$
 for  $M_{x2} > 0$  and  $M_{y2} <= 0$ 

$$= 90^{\circ}$$
 for  $M_{x2} = 0$  and  $M_{y2} < 0$ 

$$= 270^{\circ}$$
 for  $M_{x2} = 0$  and  $M_{y2} > 0$ 

### 3-axis E-Compass Calibration

- 3-axis e-compass may not get right azimuth data
  - Misalignment
  - Magnetometer
    - Hard-iron distortion
      - It is a constant additive value to the output of each of the magnetometer axes.
    - Soft-iron distortion
      - Soft-iron distortion cannot be compensated with a simple constant; instead, a more complicated procedure is required.
- Calibration sequence is related to hardware

#### Calibration for LSM303DLHC

- Accelerometer
  - All ST MEMS accelerometers are factory calibrated, allowing the user to avoid any further calibration for most of the applications now present in the market.
  - Calibration Matrix :

$$\begin{bmatrix} A_{x1} \\ A_{y1} \\ A_{z1} \end{bmatrix} = \begin{bmatrix} A_{x1} \\ A_{y1} \\ A_{z1} \end{bmatrix} = \begin{bmatrix} A_{x1} \\ A_{x1} \\ A_{x1} \end{bmatrix} \begin{bmatrix} 1/A_{x1} \\ 0 \\ 0 \\ 0 \end{bmatrix} \begin{bmatrix} A_{x1} \\ A_{x1} \\ A_{x1} \\ A_{x1} \end{bmatrix} \begin{bmatrix} A_{x1} \\ A_{x1} \\ A_{x1} \\ A_{x1} \end{bmatrix} \begin{bmatrix} A_{x1} \\ A_{x1} \\ A_{x1} \\ A_{x2} \end{bmatrix} \begin{bmatrix} A_{x1} \\ A_{x1} \\ A_{x2} \\ A_{x1} \end{bmatrix} \begin{bmatrix} A_{x1} \\ A_{x1} \\ A_{x2} \\ A_{x1} \end{bmatrix} \begin{bmatrix} A_{x1} \\ A_{x1} \\ A_{x2} \\ A_{x2} \end{bmatrix} \begin{bmatrix} A_{x1} \\ A_{x1} \\ A_{x2} \\ A_{x1} \end{bmatrix} = \begin{bmatrix} A_{x1} \\ A_{x1} \\ A_{x2} \\ A_{x1} \end{bmatrix} \begin{bmatrix} A_{x1} \\ A_{x1} \\ A_{x2} \\ A_{x2} \end{bmatrix} \begin{bmatrix} A_{x1} \\ A_{x1} \\ A_{x2} \\ A_{x1} \end{bmatrix} \begin{bmatrix} A_{x1} \\ A_{x1} \\ A_{x2} \\ A_{x1} \end{bmatrix} \begin{bmatrix} A_{x1} \\ A_{x1} \\ A_{x2} \\ A_{x1} \end{bmatrix} \begin{bmatrix} A_{x1} \\ A_{x1} \\ A_{x2} \\ A_{x1} \end{bmatrix} = \begin{bmatrix} A_{x1} \\ A_{x1} \\ A_{x2} \\ A_{x1} \end{bmatrix} \begin{bmatrix} A_{x1} \\ A_{x1} \\ A_{x2} \\ A_{x1} \end{bmatrix} \begin{bmatrix} A_{x1} \\ A_{x1} \\ A_{x2} \\ A_{x1} \end{bmatrix} \begin{bmatrix} A_{x1} \\ A_{x1} \\ A_{x2} \\ A_{x1} \end{bmatrix} \begin{bmatrix} A_{x1} \\ A_{x1} \\ A_{x1} \\ A_{x2} \\ A_{x1} \end{bmatrix} \begin{bmatrix} A_{x1} \\ A_{x1} \\ A_{x1} \\ A_{x2} \\ A_{x1} \end{bmatrix} \begin{bmatrix} A_{x1} \\ A_{x1} \\ A_{x1} \\ A_{x2} \\ A_{x1} \end{bmatrix} \begin{bmatrix} A_{x1} \\ A_{x1} \\ A_{x1} \\ A_{x2} \\ A_{x1} \end{bmatrix} \begin{bmatrix} A_{x1} \\ A_{x1} \\ A_{x2} \\ A_{x1} \\ A_{x2} \\ A_{x1} \end{bmatrix} \begin{bmatrix} A_{x1} \\ A_{x1} \\ A_{x2} \\ A_{x1} \\ A_{x2} \\ A_{x1} \end{bmatrix} \begin{bmatrix} A_{x1} \\ A_{x1} \\ A_{x2} \\ A_{x1} \\ A_{x2} \\ A_{x1} \end{bmatrix} \begin{bmatrix} A_{x1} \\ A_{x1} \\ A_{x2} \\ A_{x1} \\ A_{x2} \\ A_{x1} \end{bmatrix} \begin{bmatrix} A_{x1} \\ A_{x1} \\ A_{x2} \\ A_{x1} \\ A_{x2} \\ A_{x1} \end{bmatrix} \begin{bmatrix} A_{x1} \\ A_{x1} \\ A_{x2} \\ A_{x1} \\ A_{x2} \\ A_{x1} \\ A_{x2} \\ A_{x3} \\ A_{x4} \\ A_{x4}$$
